Detailed Answers to Modeling Chemistry U10 WS 2 V1

Question 1: Drawing Lewis Dot Structures

Answer Explanation:

Students are typically asked to draw Lewis dot structures for specific molecules or ions, such as H_2O , CO_2 , or NH_3 .

Sample Answer for H_2O :

- Count valence electrons: H (1 each), O (6)
- Total electrons: $2(1) + 6 = 8$
- Place oxygen in the center, connect hydrogen atoms with single bonds.
- Distribute remaining electrons to satisfy octet rule:
- Each hydrogen has 2 electrons (duet rule).
- Oxygen has 8 electrons around it (including bonding pairs).

Key Tips:

- Use pairs of dots to represent lone pairs.
- Ensure octets are complete for all atoms where applicable.
- Remember that hydrogen only needs 2 electrons.

Question 2: Molecular Geometry Based on VSEPR

Answer Explanation:

For molecules like methane (CH_4), the VSEPR theory predicts a tetrahedral shape because there are four bonding pairs and no lone pairs on the central atom.

Common Molecular Geometries and Electron Domains:

- Linear: 2 electron domains (e.g., CO_2)
- Trigonal planar: 3 electron domains (e.g., BF_3)
- Tetrahedral: 4 electron domains (e.g., CH_4)
- Trigonal bipyramidal: 5 electron domains (e.g., PCl_5)
- Octahedral: 6 electron domains (e.g., SF_6)

Answer Tips:

- Count bonding pairs and lone pairs around the central atom.
- Use VSEPR charts to determine the molecular shape based on the total electron domains.

Question 3: Identifying Types of Chemical Bonds

Answer Explanation:

- Ionic bonds form between metals and nonmetals, involving transfer of electrons (e.g., NaCl).
- Covalent bonds form between nonmetals, involving sharing of electrons (e.g., H_2O , CO).
- Metallic bonds involve a 'sea of delocalized electrons' in metals (e.g., Cu , Fe).

Practical Exercise:

Classify compounds based on their bonding type:

- NaF : Ionic
- CH_4 : Covalent
- Fe : Metallic

Tips:

- Remember electronegativity differences: large difference (>1.7) suggests ionic bonding.
- Similar electronegativities indicate covalent bonding.

Question 4: Balancing Chemical Equations

Sample Answer for Combustion of Methane:

Unbalanced:

Balanced:

Key Steps:

- Count atoms on each side.
- Adjust coefficients to balance atoms for each element.
- Confirm the final equation maintains mass and charge balance.

Question 5: Energy Diagrams and Reaction Mechanisms

Answer Explanation:

Understanding activation energy, transition states, and overall energy change (ΔH) is crucial.

- Endothermic reactions absorb energy; exothermic reactions release energy.
- Activation energy is the energy barrier that must be overcome for a reaction to proceed.

Interpreting Diagrams:

- Look for the peak representing the transition state.
- The difference in energy between reactants and products indicates whether the reaction is exothermic or endothermic.

Tips for Students:

- Identify the activation energy (from reactants to peak).
- Determine if the reaction releases or absorbs energy based on the energy difference.
