The Ba Pollock is characterized by its elongated body shape, typically reaching lengths of up to 60 centimeters in mature individuals. Its coloration varies from silvery-gray to darker hues, often with subtle mottling that provides excellent camouflage in rocky and vegetative habitats. Notable features include a streamlined body, sharp dorsal fins, and a slightly forked tail, all of which contribute to its swift swimming capabilities.

Diet and Feeding Habits

This species is carnivorous, primarily feeding on smaller fish, crustaceans, and invertebrates. Its keen senses and agile movements allow it to hunt effectively in complex environments. In captivity, Ba Pollock can be fed a diet consisting of high-quality pellets, live or frozen brine shrimp, and other suitable meaty foods.

Reproductive Behavior

Breeding behavior in Ba Pollock is still under scientific investigation, but observations suggest that they spawn during specific seasonal periods, typically in warmer months. They exhibit external fertilization, with females releasing eggs into the water where males fertilize them externally. The hatchlings are planktonic before settling into benthic habitats.

Habitat and Distribution

Natural Habitat

The Ba Pollock thrives in cold, temperate freshwater environments, often inhabiting river basins, lakes, and estuarine zones. They prefer rocky substrates and submerged vegetation that provide cover and breeding grounds. Their habitat selection reflects their need for well-oxygenated waters and ample hiding spots to evade predators.
